I'm looking for a way to open up the blank setup file and modify it to do the things I need. The CNC setup file can be found here: I'm looking for a way to alter the 6 part table from the examples, and make it do everything it's supposed to do (only). I can't seem to get the utility to open. I have asked a (now deleted) post about what the problem was, but I don't remember the answer. Since I deleted it, I can't get the answer. I have tried looking through the documentation. This isn't a supported project. It's an ArtCAM part. I'm hoping someone out there has an answer. I don't want to start the whole process over, so if someone could walk me through what to do, that would be great. I just don't have the funds to take it to the vendor for the proper amount of time. I've been reading the documentation and the help file, but I don't know how to navigate the examples file. I'm not really sure what the.txt file I'm looking at is. I'm very new to this. How do I get it to open in ArtCAM? If the file is a part of ArtCAM, is it loaded into ArtCAM when you run the utility? I'm not sure what a part file is. I don't know what you mean by loaded. I have a.txt file that says "Loaded" at the top, and it looks like ArtCAM has loaded it. Do you mean if I copy that file to another directory, will it run? I have run it from that directory, and it did the same thing it did from the original location. No errors. No, that file is not a part file. It is a file that contains the description for the project. You will need the.part file to load the project, and the.txt file will tell you how to load the project. From the command line, when you run the utility, it will ask you where you want to load the project from. In the current folder, the answer would be the file you are looking at now. If you have ArtCAM open, you should be able to double click the file and 82157476af
